

Concrete caulking involves applying a polymer caulk to fill gaps and cracks in concrete surfaces. This process helps to keep out water, pests, and weeds, which can cause further damage to the concrete.

Safeguard your driveway, garage, pool deck, sidewalks, patio, and other expansion joints with expert concrete caulking from Helitech.

Concrete Caulking System

Professional Installation

We make it look easy, but there's a lot to consider when planning home renovation or repair projects.

Our patented process ensures the materials consistently perform as intended, year after year.

1. Site Preparation

The existing mortar is removed using a saw, and the application area is thoroughly cleaned out.

2. Apply the Caulk

Using a caulk gun, a steady bead of caulk is inserted into and along the crack.

3. Remove Excess

Excess caulk is removed with a putty knife to ensure a smooth surface.

4. Conceal

To conceal the caulk, sand is scattered over the top before drying.

5. Complete

The concrete joint is now sealed and protected!
